

RC Plane Modeling Project

By Johann Kaufmann, Teo Schnell,
& Chris Chavez

Modeling the flight of a RC Airplane

Goal is to build a model which dynamically shows the behavior of the aircraft as wattage and oncoming airspeed changes.

To do this we need

- Thrust formula
- Drag formula
- Mass $\rightarrow$ 1.0kg (Very Convenient)
- Find Velocity of the Exhaust (V_e) given watts and airspeed
 - Component of Thrust

Procedure to calculations

$$\frac{1}{2} * P * A_{\text{prop}} * (V_e^2 - V_o^2) \rightarrow \text{Thrust}$$

$$V_e = \text{Base_}V_e + V_o^{2/3}$$

$$\frac{1}{2} * C * A_{\text{plane}} * V_o^2 \rightarrow \text{Drag}$$

$$(\text{Thrust} - \text{Drag}) / \text{mass} \rightarrow \text{acceleration}$$

$$\text{Acceleration} * \text{Time_Step} \rightarrow \text{Velocity}$$

$$\text{Time_Step} * \text{Velocity} \rightarrow \text{Displacement}$$

$$\text{Time_Step} = 0.01$$

Key:

P = Air density = 1.255

A_plane = 0.10

A_prop = 0.025

C = drag coef = 0.10

V_e = Velocity thrust

V_o = Velocity plane

$$\text{Thrust} = 0.5 * p * A * (V_e^{**2} - V_o^{**2})$$

Propeller Thrust | Glenn

Research Center | NASA

$$V_e = \text{Base} V_e + V_o^{(2/3)}$$

Base $V_e \rightarrow$ as Function states

- $P = 1.255 \text{ km/m}^3$
 - Air Density
- $A = 0.025 \text{ m}^2$
 - Prop Area
- $V_o = \text{VAR}$
 - Speed of Plane

$$\begin{aligned} \text{Thrust} = F &= \dot{m}_e V_e - \dot{m}_o V_o & \Delta p &= pt_e - pt_o \\ \dot{m}_e &= \dot{m}_o = r V_p A & \Delta p &= .5 r (V_e^2 - V_o^2) \\ F &= r V_p A (V_e - V_o) & F &= A \Delta p = .5 r A (V_e^2 - V_o^2) \\ V_p &= .5 (V_e + V_o) \end{aligned}$$

Watts Relation to V_e

$$5.83805 \ln(0.14987 \times \text{Watts})$$

Derived Using SciPy

- Finding the Line of Best Fit
- Take the Inverse

SciPy

Efficiency Loss

- Issues with Prop. Driven Aircraft
- Propellers lose “efficiency” as the plane move faster
- This is why we use Jets

Wind Tunnel?

Distinctly No Wind Tunnel →

Cabrillo

Gathering Airspeed Data → Anemometer

Plane Car

It's a plane, mounted to a car

Calculating Velocity Exhaust(V_e) relation to Airspeed(V_o)

Drag

$$\text{Drag} = .5 * C_p A * V_o^2$$

- $C = 0.1$
 - Average Drag Coefficient
 - Pretty Much just an educated guess
- $P = 1.255 \text{ kg/m}^3$
 - Air Density at sea level
- $A = 0.1 \text{ m}^2$
 - Frontal Area of the Plane (πr^2)
 - Measured with *Geometry*

Drag Coefficient Approximation

- 0.04 → Airfoil
- Fuselage
 - Less Efficient
- Thus always higher than 0.04
- 0.10 is quite good, not implausible.
- Model was tested with other coefficients
 - 0.07 - 0.20

Shape		Drag Coefficient
Sphere	→ 	0.47
Half-sphere	→ 	0.42
Cone	→ 	0.50
Cube	→ 	1.05
Angled Cube	→ 	0.80
Long Cylinder	→ 	0.82
Short Cylinder	→ 	1.15
Streamlined Body	→ 	0.04
Streamlined Half-body	→ 	0.09

Measured Drag Coefficients

Sample Calculation

$F_{\text{net}} = \text{Thrust} - \text{Drag}$

$\text{Thrust} = \frac{1}{2} \rho \cdot A_{\text{nozzle}} (V_e^2 - V_0^2)$

$\text{Drag} = \frac{1}{2} C \cdot \rho \cdot A_{\text{plane}} \cdot V_0^2$

$\rho = 1.225 \text{ kg/m}^3$

$A_{\text{nozzle}} = 0.025 \text{ m}^2$

$A_{\text{plane}} = 0.10 \text{ m}^2$

$C = 0.10 \leftarrow \text{drag coefficient}$

πr^2
 $r = 0.0889 \text{ m}$
 $\downarrow$
 $\approx 0.025 \text{ m}^2$

$V_e \rightarrow \text{Base } V_e + 1.09 \sqrt{V_0}$
 $V_0 \rightarrow \text{measured}$

$\text{Base } V_e = 5.83205 \ln(0.14987 \cdot \text{Watts})$
↑ measured

When Watts = 800w $V_e = 0 + 27.94 \text{ m/s}$ $\text{Thrust} = 12.24 \text{ N}$ $\text{Drag} = 0$	$a = \frac{F}{m} \approx 1.06g$ $V_e = 1.09 \sqrt{0.1225} + \text{Base } V_e = 28.32$ $\text{Base } V_e = 27.94$ $T = 12.58 \text{ N}$ $D = 0.000094 \text{ N}$ $\text{Net} = 12.58 \text{ N}$	$V_e = 28.48 \text{ m/s}$ $\text{Base } V_e = 27.94 \text{ m/s}$ $\text{Thrust} = 12.72 \text{ N}$ $\text{Drag} = 0.0003859 \text{ N}$ $\text{Net} = 12.72 \text{ N}$
--	--	---

Sample Calculation

Time	X (m)	V (m/s)	A (m/s ²)	F_Net (N)
0.00	0.00	0.00	12.25	12.24
0.01	0.00	0.1225	12.58	12.58
0.02	0.0012	0.248	12.72	12.72

Experiential vs Theory → 200 Watts

Predict. Max: 86.4km/h | 24.3m/s

Actual Max: 83.0 km/h | 23.1m/s

Experiential vs Theory → 305 Watts

Predict. Max: 97.2km/h | 27.2m/s

Actual Max: 95 km/h | 25.6m/s

Experiential vs Theory → 800 Watts

Predict. Max: 118.8km/h | 33.1m/s

Actual Max: 120km/h | 33.3m/s

Position vs Time

Position vs. Time @ 200 Watts
